Team ID	-
Project Title	Food Ordering Behaviour and Consumer Trends
Maximum Marks	10 Marks

Data Exploration and Preprocessing Template

Identifies data sources, assesses quality issues like missing values and duplicates, and implements resolution plans to ensure accurate and reliable analysis.

Section	Description
Data Overview	The Food Ordering Behaviour dataset contains approximately 50,000 food-order records and 19 attributes . The dataset includes information such as City, Cuisine, Meal Type, Restaurant Type, Order Value, Delivery Fee, Rating Given, Discount Applied, Repeat Order, Mood, Hunger Level, Company, and Weather conditions.
Data Cleaning	The dataset was examined for missing values, duplicate records, inconsistent categorical values, and invalid entries. Required fields were checked before analysis, and duplicate or invalid records, where identified, were handled to maintain data accuracy.
Data Transformation	Data was filtered and organized according to the requirements of the analysis. Aggregations such as COUNT(Order Id) and AVG(Order Value) were used in Tableau to analyze order volumes and customer spending. Filters were also applied to allow analysis based on City, Cuisine, Meal Type, Restaurant Type, and other relevant fields.
Data Type Conversion	Data types of all relevant fields were verified in Tableau. Numerical fields such as Order Value, Delivery Fee, Rating Given, and Time Taken to Order were treated as measures, while fields such as City, Cuisine, Meal Type, Restaurant

	Type, and Discount Applied were treated as categorical dimensions.
Column Splitting and Merging	No major column splitting or merging was required because the dataset already contained separate fields required for the analysis. Existing columns were used directly in Tableau visualizations.
Data Modeling	The project uses a single CSV dataset , therefore relationships between multiple tables were not required. Tableau's dimensions, measures, aggregations, filters, and calculated fields were used to perform the required analysis.
Save Processed Data	The prepared Tableau workbook and data source were saved for dashboard development. The processed data was used to create c and interactive dashboards for analyzing food-ordering behaviou
